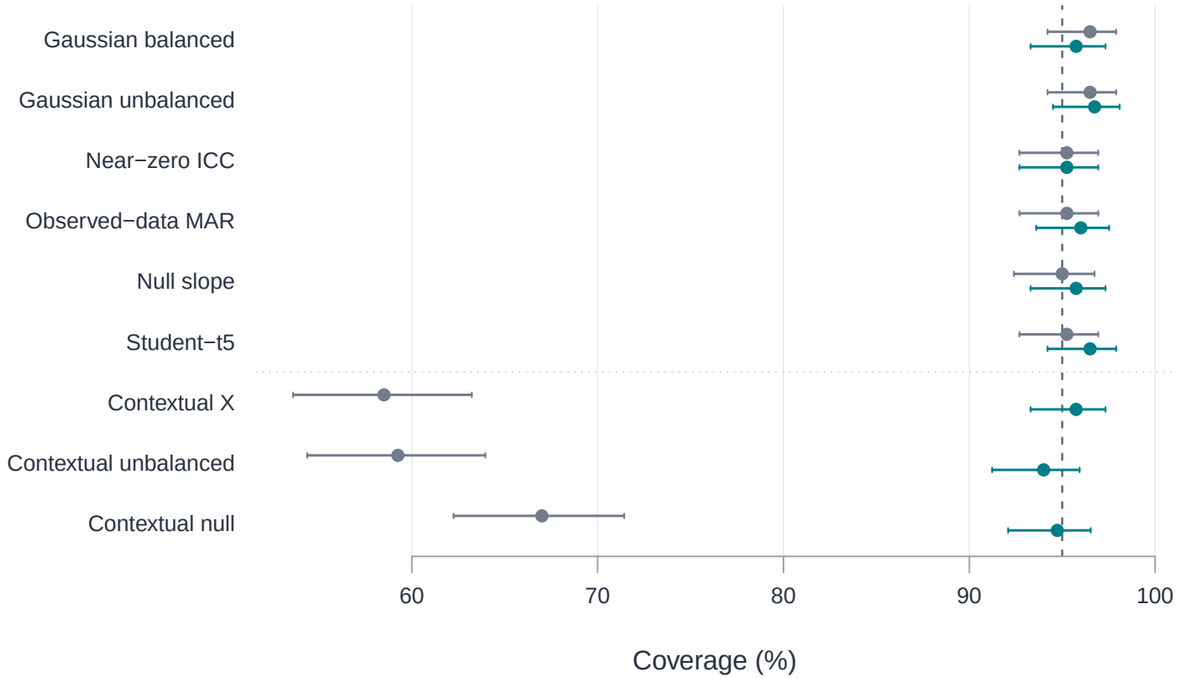
Joint marginal model: fresh confirmation evidence

Prespecified synthetic scenarios; posterior credible intervals remain conditional on each model and prior

● v0.9 conditional joint: direct summary ● New marginal joint: direct summary

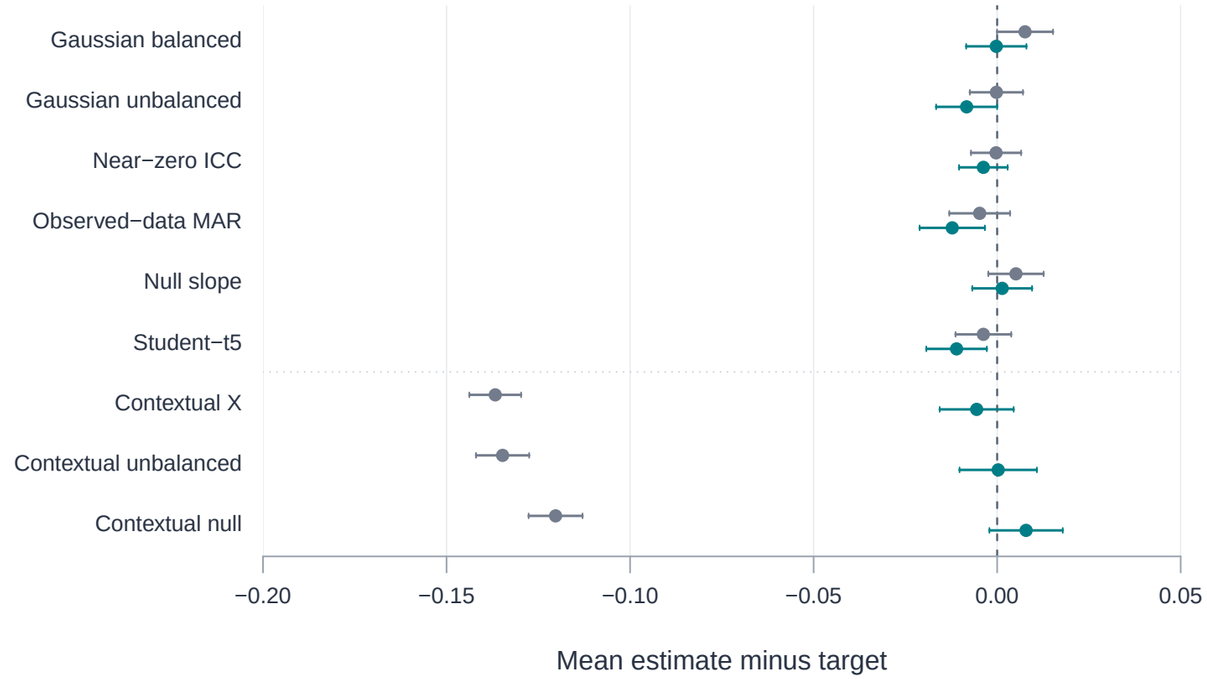
A Coverage of the population marginal slope

400 cohorts per scenario; denominator = returned intervals



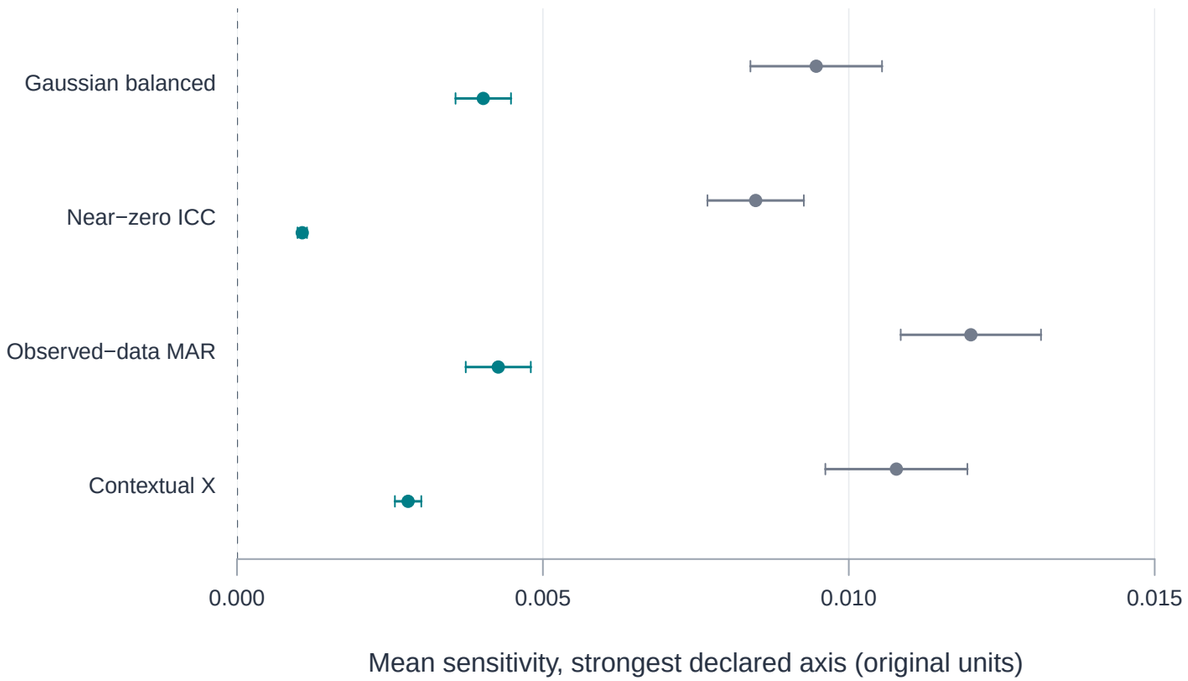
B Bias for the same population target

Same marginal targets in contextual cells: 0.9, 0.9 and 0



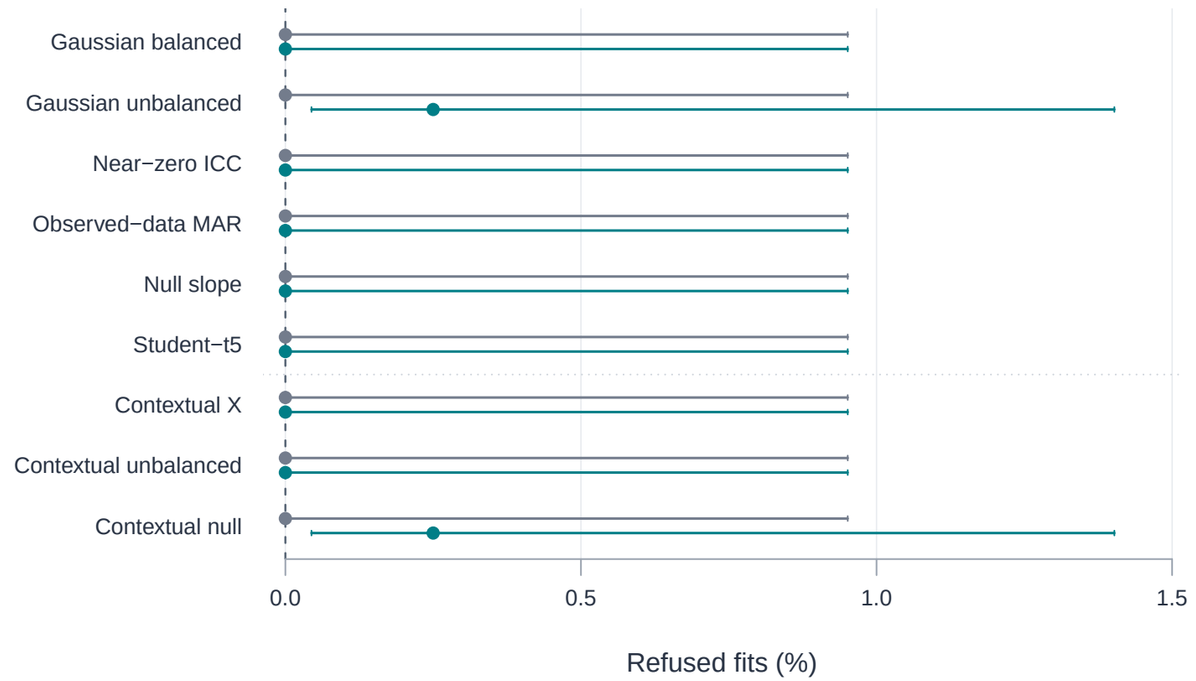
C Sensitivity of the single−predictor slope

Old IW axis; new maximum of HW and regression−scale axes



D Numerical fit refusals

All 400 default−prior fit requests per scenario



Error bars show 95% Monte Carlo uncertainty: Wilson intervals for proportions; normal intervals for mean bias and sensitivity.

Sensitivity uses common old−three/new−five sets and the larger new sensitivity axis. Paired inference and all analysis refusals remain in the numerical evidence files.
