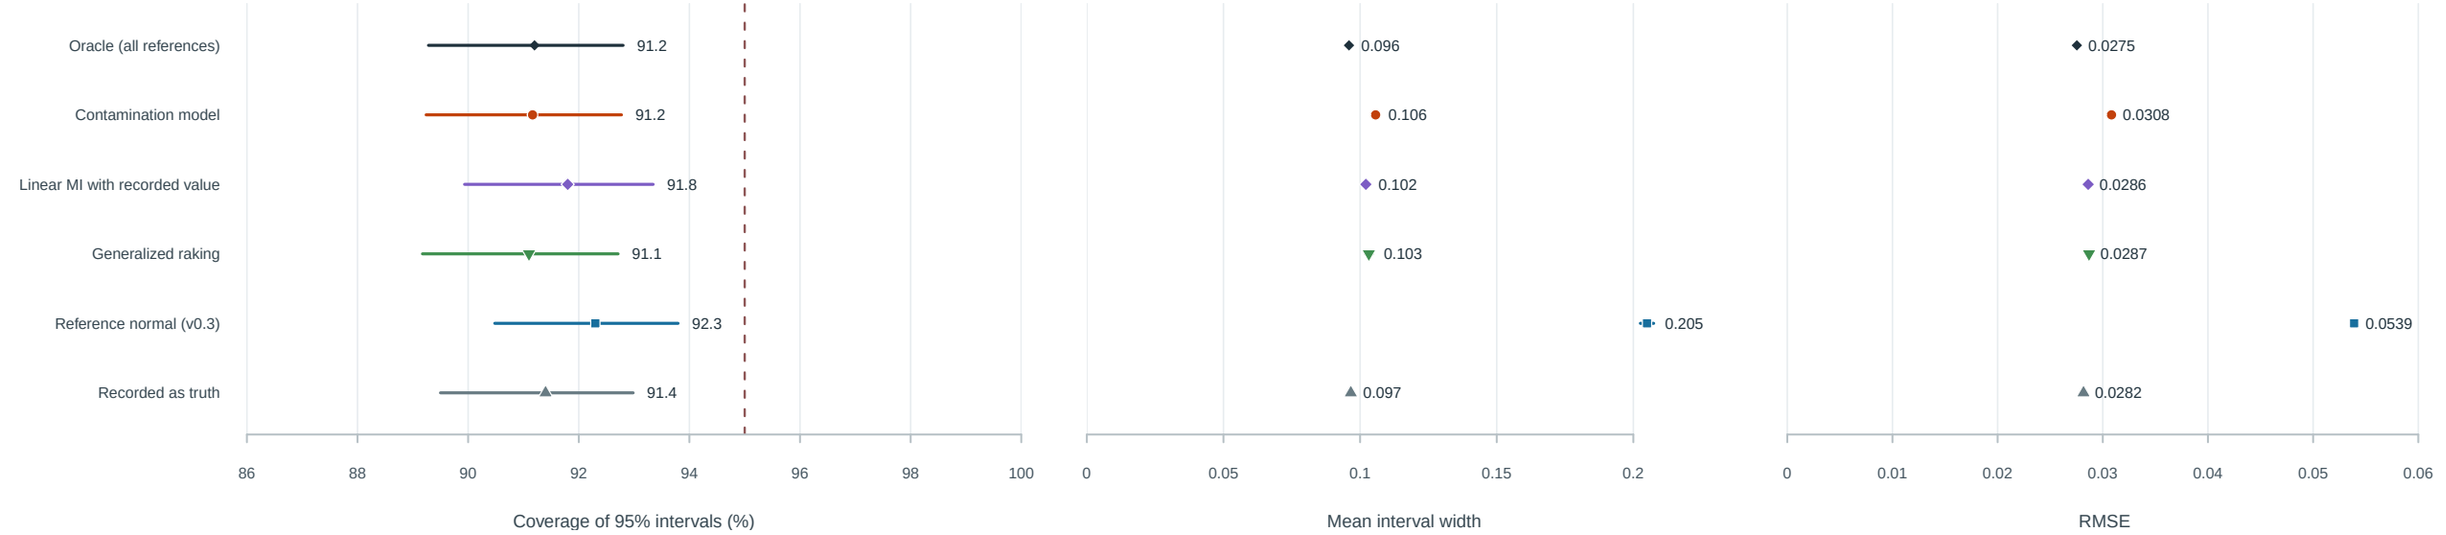
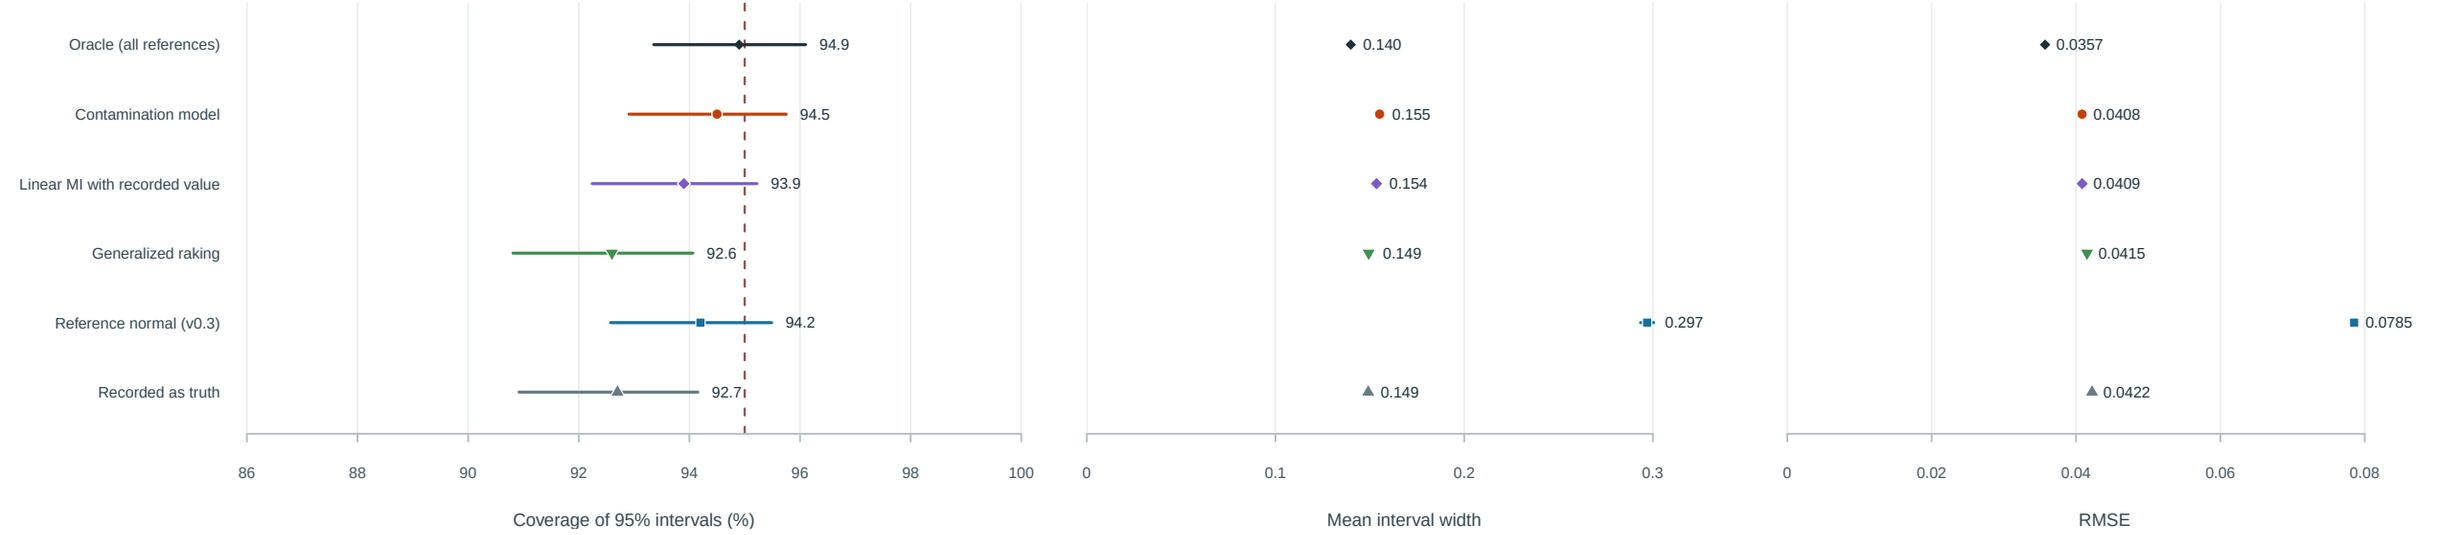
Real recording differences: a useful gain, but not the best tool

Random 25% audit | 1,000 cohorts of 600 drawn from each evaluation pool | Target is the whole pool's coefficient using references

ClinicalTrials.gov: enrollment against participant−flow total



NHANES: self−reported against measured weight



Coverage bars: 95% Wilson Monte Carlo intervals; dashed line: nominal 95%. Width bars: mean +/− 1.96 MCSE. Oracle coverage on ClinicalTrials.gov is below 95%, consistent with non−constant residual variance. Conditional on returned intervals. Neither dataset is a clinical source−data audit. Both values on ClinicalTrials.gov are sponsor−entered.
