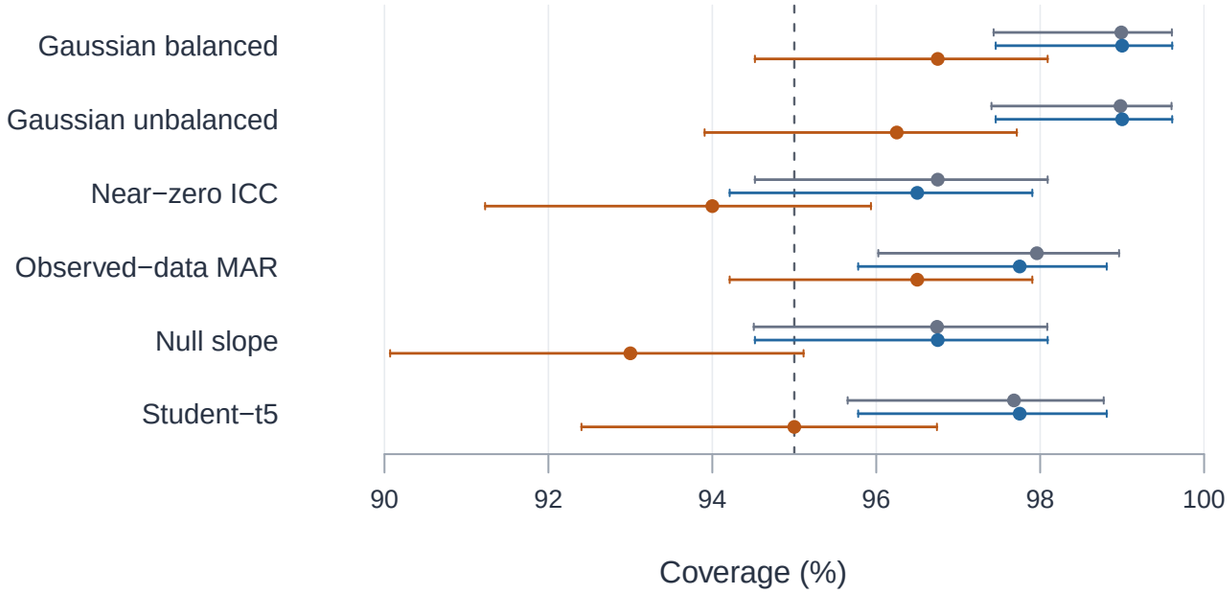
Joint reference model: confirmation evidence

Prespecified synthetic scenarios; model−based credible intervals and CV3/Rubin confidence intervals

Old sampler + CV3 CI · Longer−run sampler + CV3 CI · Direct posterior credible interval

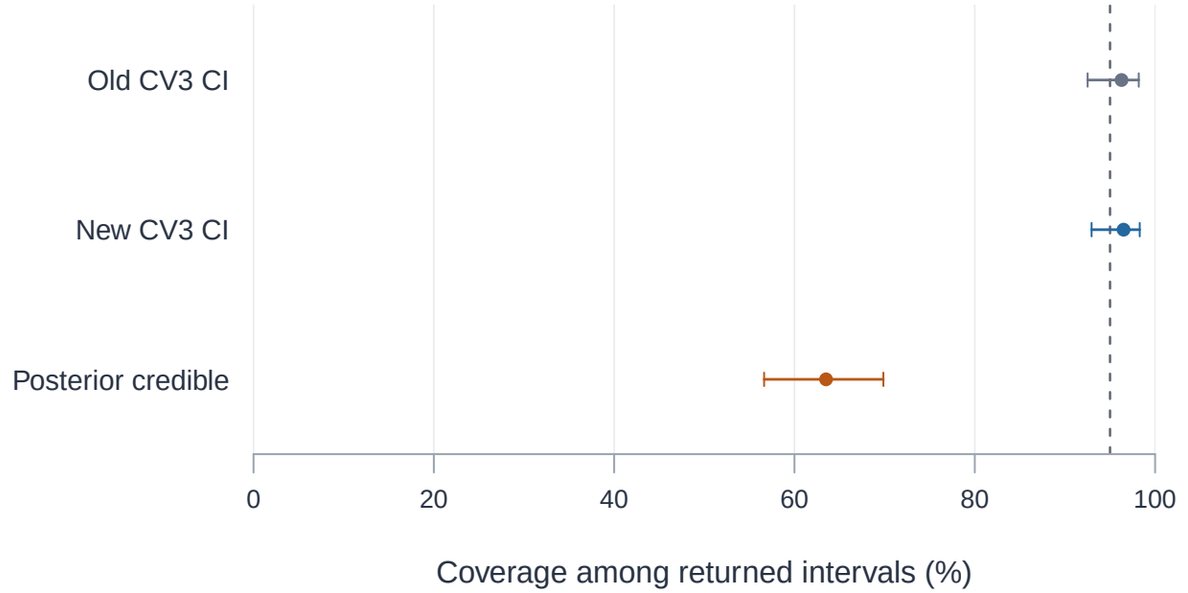
A Coverage in the six original scenarios

400 cohorts per scenario; coverage among returned intervals



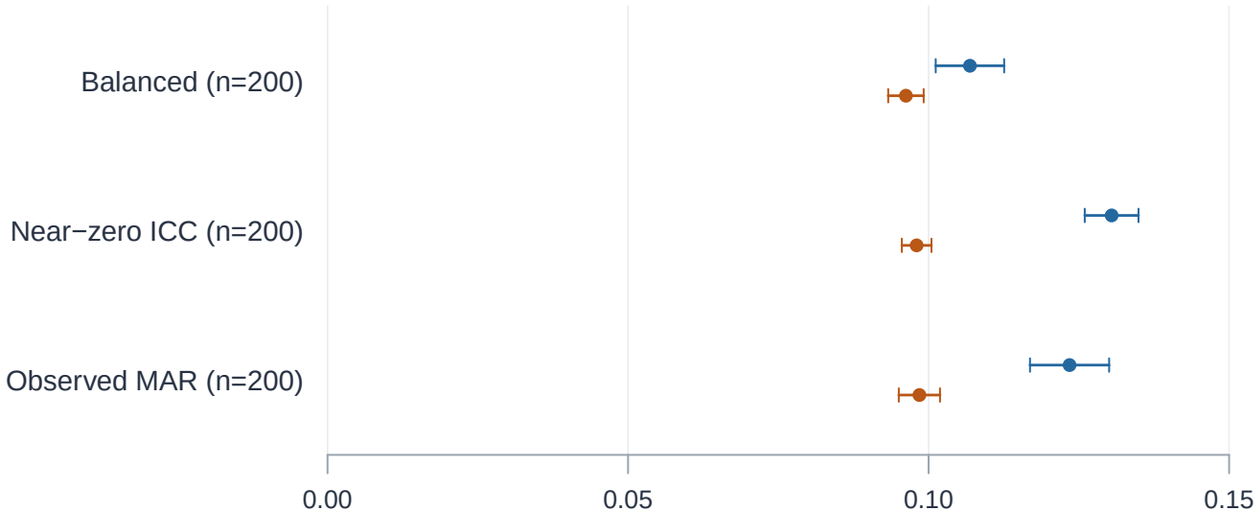
B Contextual−X assumption stress

200 cohorts; marginal target 0.9, structural slope 0.7



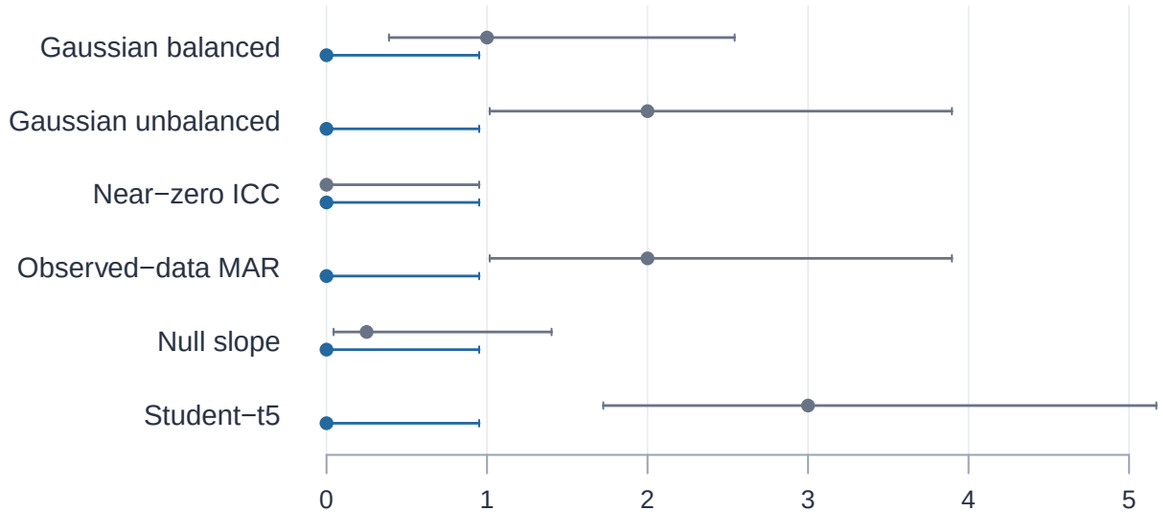
C Relative sensitivity of interval width

Common complete triples; covariance−prior scales 0.25, 1 and 4



D Numerical fit refusals

Old / longer−run sampler; all 400 fit requests per scenario



Error bars show 95% Monte Carlo uncertainty: Wilson intervals for proportions; normal intervals for mean S.

Coverage conditions on a returned interval. Contextual X deliberately violates the model. These results do not establish universal validity.
